## Summary of CV

This section describes briefly a summary of your career in science, academic and research; the main scientific and technological achievements and goals in your line of research in the medium -and long- term. It also includes other important aspects or peculiarities.

In general, my research career has been developed within the area of Molecular and Cellular Biology applied to the study of the pathogenesis processes of various infectious diseases (viruses and prions), as well as to the development of useful biotechnological tools for the study and the control of these diseases. Throughout my professional career, three stages can be distinguished with specific but closely related scientific objectives:

-Stage 1 (1985-1991) .- At this stage, corresponding to the beginning of my research career (doctoral thesis and first postdoctoral stay), my research focused on the study of basic processes of cell proliferation and its implications in activation of cells of the immune system, under physiological and pathological conditions. These studies were initiated at the University of Córdoba and completed at the "Institut de Recherches Scientifiques sur le Cancer" (Villejuif-France).

-Stage 2 (1992-2001) .- This stage corresponds to my return to Spain after 5 years abroad. Includes 5 years of Researcher at the CNB-CSIC (Madrid) and 5 years at CISA-INIA (Valdeolmos-Madrid). During this stage, my research focused on the study of the molecular processes and elements involved in replication and the pathogenesis of RNA viruses of interest in animal health.

-Stage 3 (2001-present) .- A permanent Researcher position at CISA-INIA allowed me to start a new line of research and create the group of "Molecular and Cellular Biology of Prions. Since then, the general objective of this group has been the study of the biology and pathogenesis of prions. To do this, we have developed a series of models based on transgenic mice and cell cultures that express different sequences of the Cellular Prion Protein (PrPC). These models include transgenic mice that express the PrPC of different livestock species (bovine, swine, sheep or goats) that constitute highly sensitive bioassays for the detection of prions from these species. These models are being very useful for the study of the molecular elements that modulate the pathology and the species barrier of the different prion strains. Similarly, the transgenic mice that express human PrPC developed by

our group, are allowing to evaluate the zoonotic potential of the different prion strains from livestock species. On the other hand, mice that develop spongiform encephalopathy spontaneously after having included some mutations in the PrPC sequence in the transgene are providing excellent results in the study of the pathogenesis of the disease. At present, the general objective of our group is to advance in the knowledge of transmissible spongiform encephalopathies (TSEs) and their causative agents. For this, three lines of research are followed: i) Development of new bioassays for the detection and diagnosis of these diseases, ii) Study of the elements and mechanisms involved in the replication and pathogenesis of prions, iii) Study of the different prion strains in livestock species and their transmission capacity to humans.
